Michael Kramer is an assistant professor of Epidemiology at Rollins School of Public Health, Emory University. His doctoral research (completed in 2009) focused on the association of spatial segregation with racial disparities in very preterm birth, and highlighted the importance of disaggregating a complex phenotype such as preterm birth when seeking to understand mechanisms by which social determinants might “get under the skin.” He is a fellow with the WHO Perinatal Collaborating Center, and a member of the WHO Preterm Birth International Collaboration (PREBIC), and a member of the Society for Epidemiologic Research and the American Public Health Association. In addition to spatial and social determinants of preterm birth, his research includes study of segregation and neighborhood factors on life course chronic and infectious diseases including racial disparities in breast cancer survival, stroke mortality, and community HIV viral burden.
