Scott Yabiku is an Associate Professor of Sociology at Arizona State University and an affiliate of the Center for Population Dynamics. Yabiku is a social demographer whose research interests include family, fertility, and population and environment in the United States and international settings. His research frequently uses contextual and spatial data, and he has participated in the design, collection, and analysis of these data. Much of this spatial work uses the Chitwan Valley of Nepal as its setting. This research conceptualizes context as the distribution, location, and density of important social organizations, such as schools, markets, health clinics, and employers. Yabiku has found that the distribution of these organizations is related to family behaviors including marriage timing and contraceptive use. Yabiku's other work in Nepal has also linked measures of land use to family behaviors. Yabiku's population and environment research in the United States has examined human-nature interactions within the desert ecosystem of the Phoenix metropolitan area. This research has explored the associations between migration history, health status, and various measures of environmental risks. Other research has studied preferences for residential landscaping regimes and how they are related to individuals’ background characteristics, including migration history and environmental awareness.
